What is Claimed:

 A method for controlling access to an access protected unit, the method comprising:

reading at least one pair of coordinates from a base;

checking if the pair of coordinates are within a coordinate area belonging to an authorized user; and

granting access by the authorized user to the access protected unit if the coordinates are within the coordinate area belonging to the authorized user.

2. The method according to claim 1 wherein the step of reading at least one pair of coordinates further comprises:

recording a pattern from the base with a digital pen; and converting the pattern into a pair of coordinates.

- 3. The method according to claim 1 wherein the coordinate area is designated by two pairs of coordinates, the first coordinate pair designating one corner of the coordinate area and the second coordinate pair designating a second corner of the coordinate area, wherein the second coordinate pair lies diagonal to the first coordinate pair.
 - 4. The method according to claim 1, further comprising:

reading a sequence of coordinate pairs corresponding to a displacement of the digital pen by the user;

checking if the sequence of coordinate pairs favorably compares to a stored sequence of coordinate pairs belonging to the authorized user; and

granting access by the authorized user to the access protected unit, only if the sequence of coordinate pairs favorably compares to the stored sequence of coordinate pairs belonging to the authorized user.

- 5. The method of claim 4 wherein the stored sequence of coordinate pairs corresponds to a signature of the authorized user.
 - 6. The method according to claim 1, further comprising:

reading a sequence of coordinate pairs corresponding to the displacement of the digital pen by the user;

checking if the sequence of coordinate pairs favorably compares to a stored sequence of coordinate pairs associated with the access protected unit; and

granting access by the authorized user to the access protected unit, only if the sequence of coordinate pairs favorably compares to the stored sequence of coordinate pairs associated with the access protected unit.

7. The method according to claim 1, further comprising:

reading a sequence of coordinate pairs corresponding to a displacement of the digital pen by the user;

checking if the sequence of coordinate pairs favorably compares to a stored sequence of coordinate pairs associated with a program or function of the access protected unit; and

activating the program or function of the access protected unit if the sequence of coordinate pairs favorably compares to the stored sequence of coordinate pairs associated with the program or function of the access protected unit.

8. The method according to claim 1, further comprising:

reading an identification code from the digital pen;

checking if the identification code from the digital pen corresponds to an authorized identification code; and

granting access by the authorized user to the access protected unit, only if the identification code from the digital pen corresponds to the authorized identification code.

9. The method of claim 8, wherein checking if the identification code from the digital pen corresponds to an authorized identification code, further comprises the step of:

checking if the identification code from the digital pen corresponds to the at least one pair of coordinates from the base.

- 10. The method of claim 8, wherein checking if the identification code from the digital pen corresponds to an authorized identification code, further comprises checking if the identification code from the digital pen corresponds to the access protected unit.
- 11. A system for controlling a user's access to an access-protected unit, comprising:

a user unit for reading at least one pair of coordinates;

a checking device for checking, on the basis of the at least one pair of coordinates, if the user is authorized to access the access-protected unit;

providing an enabling signal to the access protected unit when the checking device determines that access is authorized.

12. The system of claim 11 wherein the user unit comprises an optical sensor and image processor.

- 13. The system of claim 11 further comprising a base provided with a position coding pattern, wherein said user unit is configured to read the position coding pattern from the base and to convert the position coding pattern to the at least one pair of coordinates.
- 14. The system of claim 11, wherein the user unit is further operable to read a sequence of coordinate pairs which describe displacement of the user unit when a user is writing with the user unit.
- 15. The system of claim 14 wherein the checking device is operable to compare the sequence of coordinate pairs with a stored sequence of coordinate pairs and, on the basis of a favorable comparison, to provide an enabling signal to the access protected unit.
- 16. The system of claim 15 wherein the stored sequence of coordinate pairs represent a user's signature.
- 17. The system of claim 15 wherein the stored sequence of coordinate pairs represents a function or program within the access protected unit, and the checking device is operable to activate the function or program within the access protected unit based on the favorable comparison.
- 18. The system according to claim 11, wherein the checking device is integrated with the user unit.
- 19. The system according to claim 11, wherein the access protected unit is integrated with the user unit.
- 20. The system according to claim 11, wherein the access protected unit is a digital pen.

- 21. The system according to claim 11, wherein information about a plurality of coordinate areas is stored in the checking device.
- 22. The system according to claim 21, wherein the access protected unit is associated with at least one of said plurality of coordinate areas.
- 23. A system according to claim 21, wherein at least one authorized user identity is associated with at least one of said plurality of coordinate areas.
- 24. The system according to claim 11 further comprising a server unit in communication with the user unit and the access protected unit.
- 25. The system according to claim 24 wherein the user unit further comprises a wireless communication unit in communication with a network access unit in communication with the server unit.
- 26. The system according to claim 24 wherein the user unit further comprises a network access unit in communication with the server unit.
- 27. The system according to claim 24 wherein the user unit further comprises a wireless communication unit in communication with the server unit.
- 28. The system according to claim 24 wherein the checking device is integrated with the server unit.
- 29. The system according to claim 11 wherein the checking device is further operable to:

read an identification code from the user unit;

check if the identification code from the user unit corresponds to an authorized identification code; and

grant access by the user to the access protected unit, only if the identification code from the user unit corresponds to the authorized identification code.

30. A checking device for checking a user's access to an access protected unit, the checking device comprising:

memory for storing information about at least one coordinate area; and a processor operative to:

receive at least one pair of coordinates;

check, on the basis of the at least one pair of coordinates, if the user is authorized to access the access-protected unit;

provide an enabling signal to the access-protected unit if the checking device determines that access is authorized.

- 31 The checking device according to claim 30 wherein the processor is further operative to check if the coordinates are lying within the at least one coordinate area for checking the user's authorization.
- 32. The checking device according to claim 30 wherein the memory is further operative to store a sequence of coordinate pairs and the processor is further operative to receive a sequence of coordinate pairs and check the received sequence of coordinate pairs with the stored sequence of coordinate pairs for checking the user's authorization.
- 33. The checking device according to claim 30, wherein the checking device is integrated with the user unit.
- 34. The checking device according to claim 30 wherein the memory stores information about a plurality of coordinate areas.

- 35. The checking device of claim 34 wherein the access protected unit is associated with one of the plurality of coordinate areas.
- 36. The checking device of claim 34 wherein a program or function is associated with one of the plurality of coordinate areas.
- 37. The checking device of claim 30 further comprising a communications interface.
- 38. The checking device of claim 35 wherein the communications interface is operable to communicate with a server unit.
- 39. The checking device of claim 35 wherein the communications interface is operable to communicate with a user unit.
- 40. The checking device of claim 35 wherein the communications interface is a wireless interface.
- 41. The checking device of claim 35 wherein the communications interface is a hard-wired interface.
- 42. The checking device of claim 30 wherein the processor is further operable to:

read an identification code from a digital pen;

check if the identification code from the digital pen corresponds to an authorized identification code; and

grant access by the user to the access protected unit, only if the identification code from the digital pen corresponds to the authorized identification code.

43. A computer-readable medium containing instructions for controlling access to an access protected unit, the instructions comprising:

reading at least one pair of coordinates from a base;

checking if the pair of coordinates are within a coordinate area belonging to an authorized user; and

granting access by the authorized user to the access protected unit if the coordinates are within the coordinate area belonging to the authorized user.

44. The computer-readable medium of claim 43 wherein the instruction for reading at least one pair of coordinates further comprise the instructions of:

recording a pattern from the base with a digital pen; and converting the pattern into a pair of coordinates.

- 45. The computer-readable medium of claim 43 wherein the coordinate area is designated by two pairs of coordinates, the first coordinate pair designating one corner of the coordinate area and the second coordinate pair designating a second corner of the coordinate area, wherein the second coordinate pair lies diagonal to the first coordinate pair.
- 46. The computer-readable medium of claim 43 wherein the instructions further comprise the instructions of:

reading a sequence of coordinate pairs corresponding to a displacement of the digital pen by the user;

checking if the sequence of coordinate pairs favorably compares to a stored sequence of coordinate pairs belonging to the authorized user; and

granting access by the authorized user to the access protected unit, only if the sequence of coordinate pairs favorably compares to the stored sequence of coordinate pairs belonging to the authorized user.

- 47. The computer-readable medium of claim 46 wherein the stored sequence of coordinate pairs corresponds to a signature of the authorized user.
- 48. The computer-readable medium of claim 43 wherein the instructions further comprise the instructions of:

reading a sequence of coordinate pairs corresponding to a displacement of the digital pen by the user;

checking if the sequence of coordinate pairs favorably compares to a stored sequence of coordinate pairs associated with the access protected unit; and

granting access by the authorized user to the access protected unit, only if the sequence of coordinate pairs favorably compares to the stored sequence of coordinate pairs associated with the access protected unit.

49. The computer-readable medium of claim 43 wherein the instructions further comprise the instructions of:

reading a sequence of coordinate pairs corresponding to the displacement of the digital pen by the user;

checking if the sequence of coordinate pairs favorably compares to a stored sequence of coordinate pairs associated with a program or function of the access protected unit; and

activating the program or function of the access protected unit if the sequence of coordinate pairs favorably compares to the stored sequence of coordinate pairs associated with the program or function of the access protected unit.

50. The computer-readable medium of claim 43 wherein the instructions further comprise the instructions of:

reading an identification code from the digital pen;

checking if the identification code from the digital pen corresponds to an authorized identification code; and

granting access by the authorized user to the access protected unit, only if the identification code from the digital pen corresponds to the authorized identification code.

51. The computer-readable medium of claim 50 wherein the instruction of checking if the identification code from the digital pen corresponds to an authorized identification code, further comprises the instruction of:

checking if the identification code from the digital pen corresponds to the at least one pair of coordinates from the base.

52. The computer-readable medium of claim 50 wherein the instruction of checking if the identification code from the digital pen corresponds to an authorized identification code, further comprises the instruction of:

checking if the identification code from the digital pen corresponds to the access protected unit.
